# Indirect $H_0$ : No Longer Just the CMB

- Two types of measurements:

## 1. Indirect

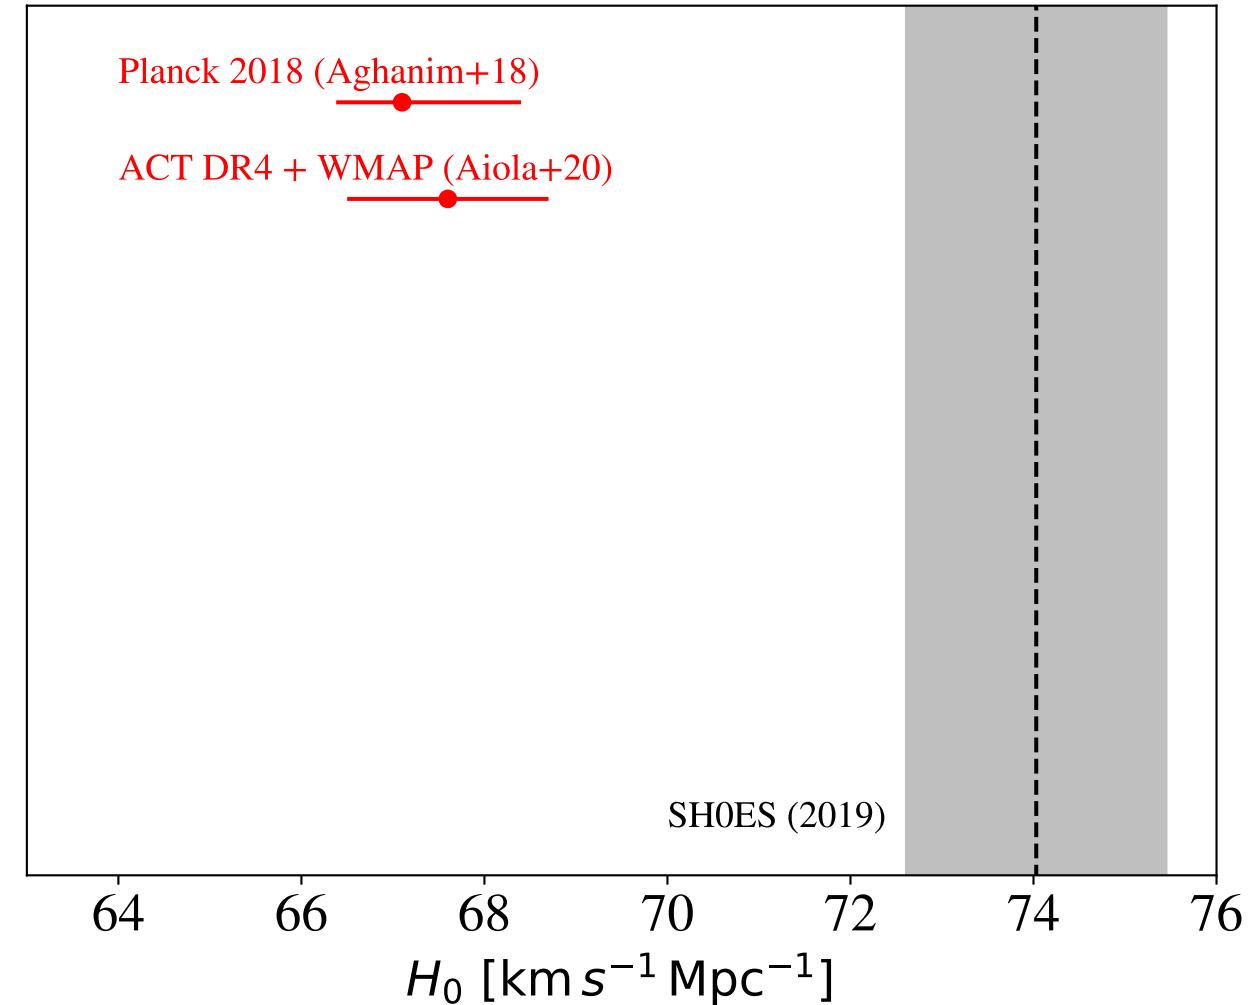

- Require a **cosmological model**

## 2. Direct

- No model required!
- e.g. distance ladders, strong lensing, ...

- Historically **indirect**  $H_0$  constraints are from the CMB

CMB

*Disclaimer:  $1\sigma$  errors do not fully represent non-Gaussian posteriors.*

# Indirect $H_0$ : No Longer Just the CMB

- Two types of measurements:

## 1. Direct

- Require a cosmological model

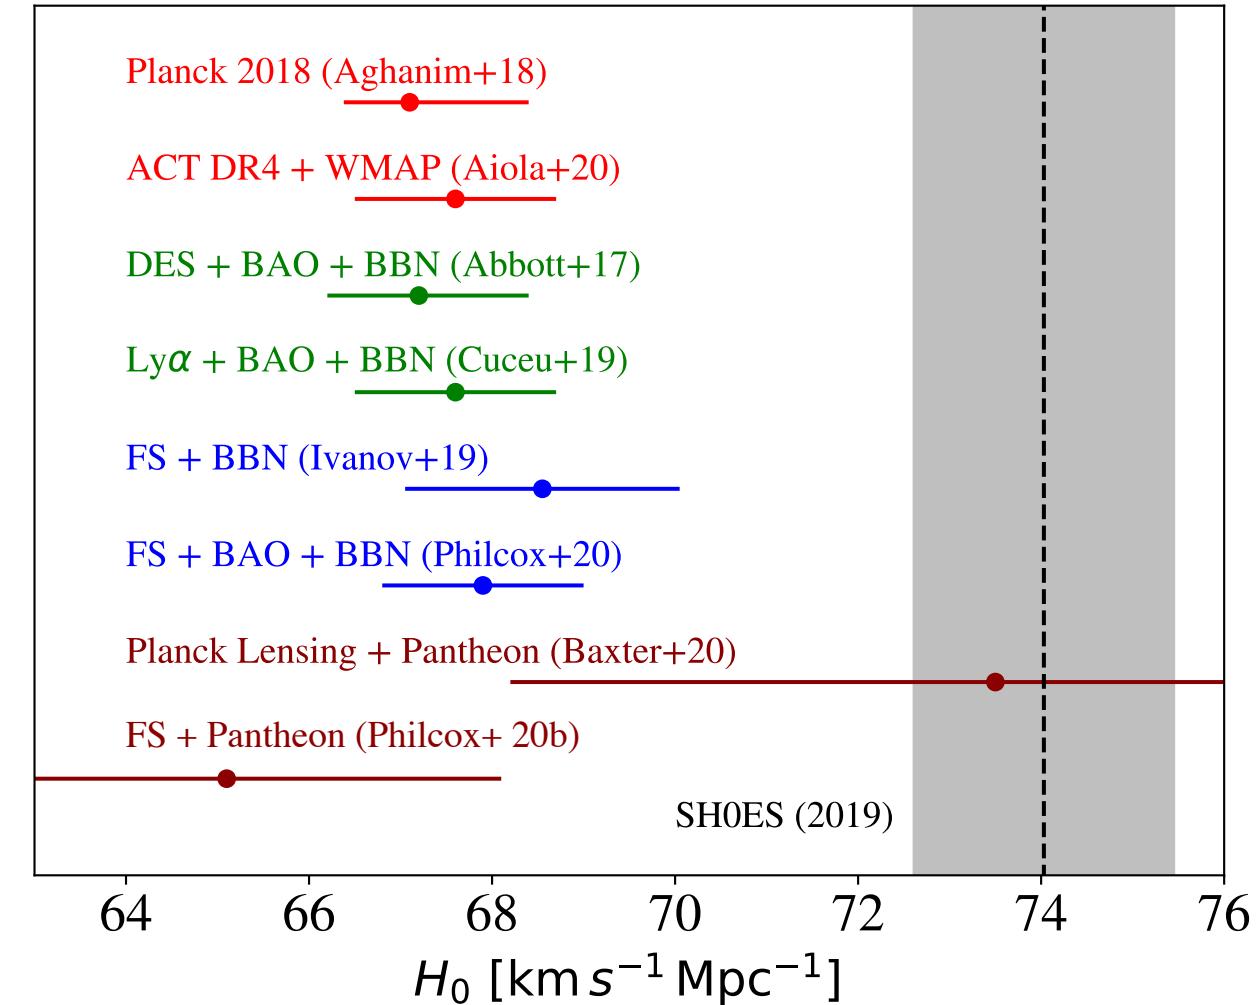

## 2. Indirect

- No model required!
- e.g. distance ladders, strong lensing, ...

- Historically **indirect**  $H_0$  constraints are from the CMB

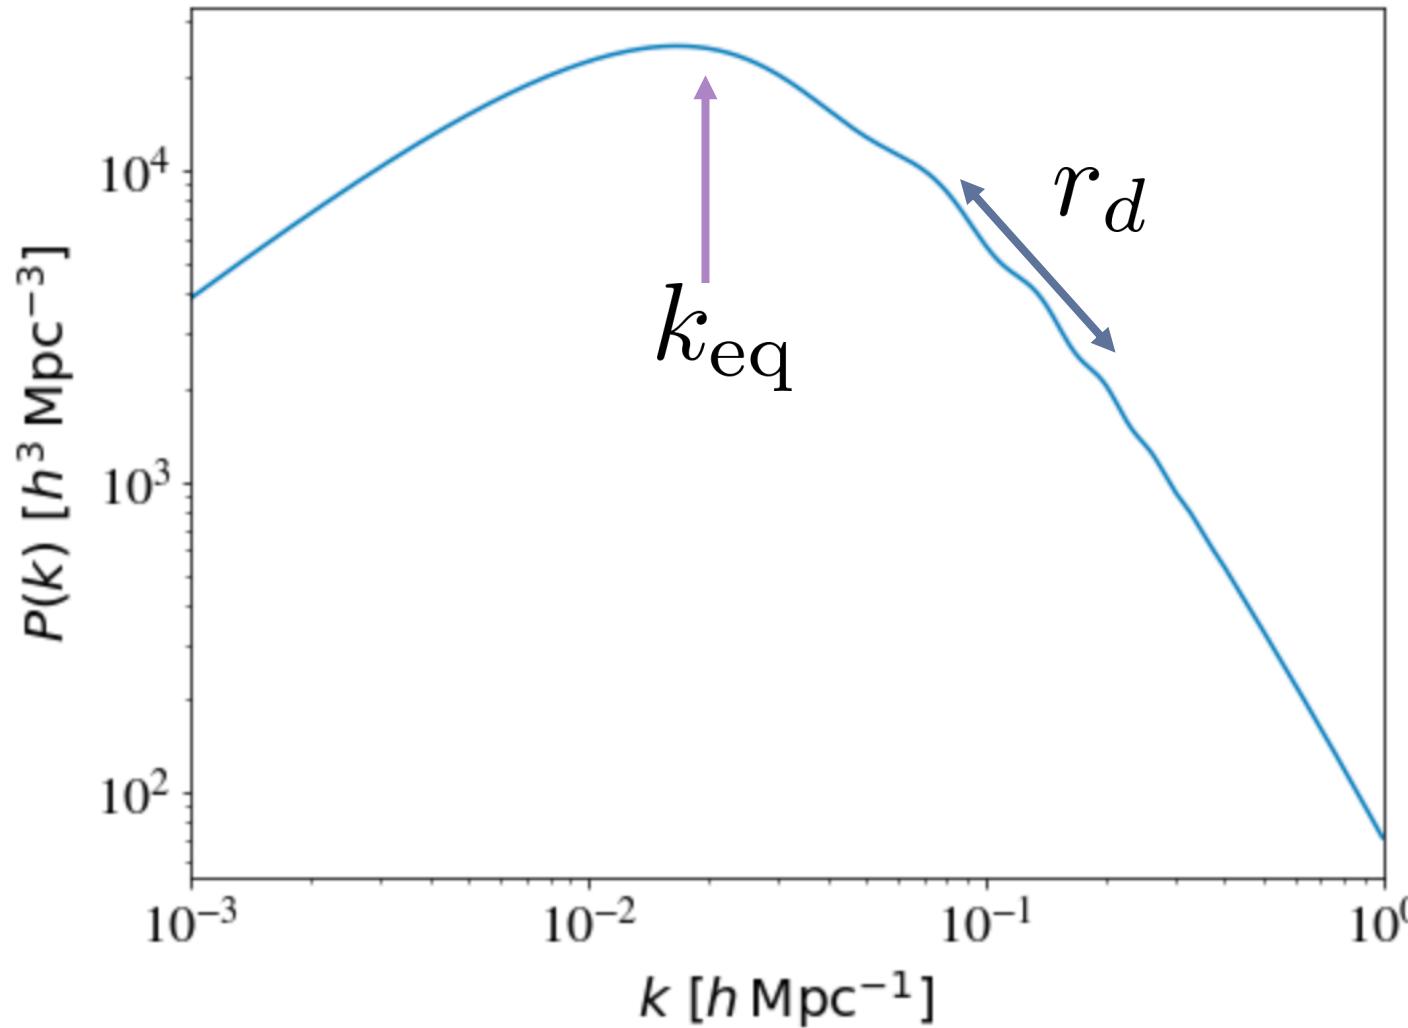

- Large Scale Structure** comparable to the CMB!

# Two Scales in the Matter Power Spectrum

1. The Equality Scale:  $k_{\text{eq}}^{-1}$ 
  - The **horizon** at radiation-matter equality ( $z \sim 3600$ )
  - Sets the **peak** and overall shape
2. The Sound Horizon:  $r_d$ 
  - The **sound horizon** at baryon drag ( $z \sim 1100$ )
  - Sets the **BAO** frequency

These are **standard rulers**

# Two Scales in the Matter Power Spectrum

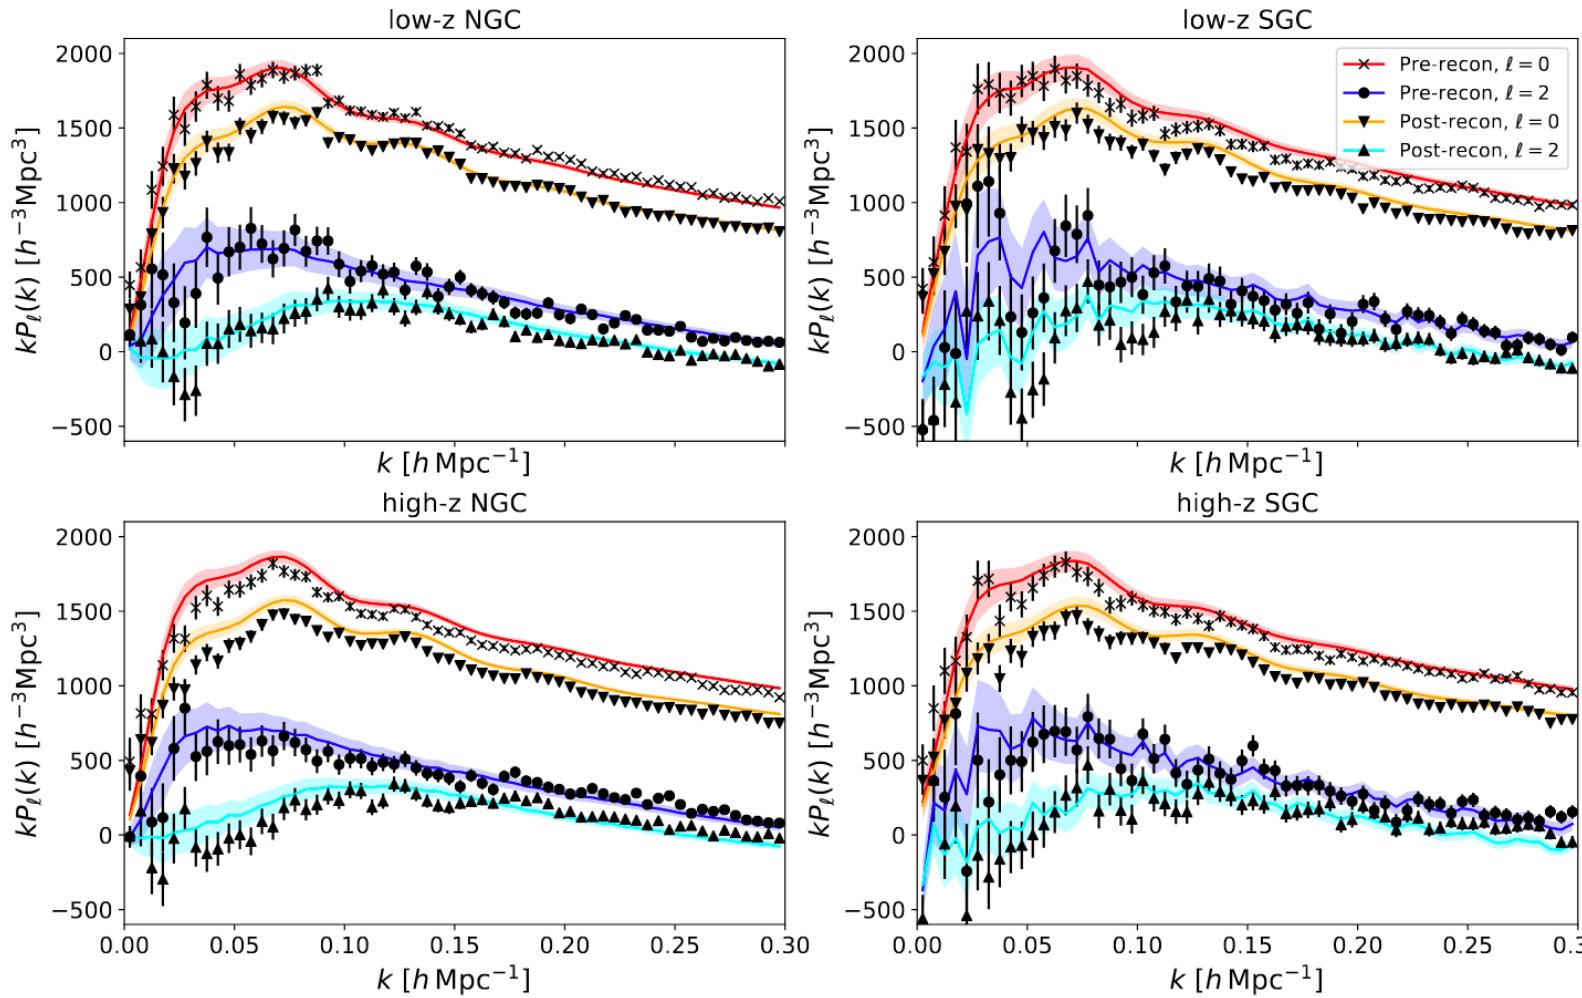

1. The Equality Scale:  $k_{\text{eq}}^{-1}$ 
  - The **horizon** at radiation-matter equality ( $z \sim 3600$ )
  - Sets the **peak** and overall shape
2. The Sound Horizon:  $r_d$ 
  - The **sound horizon** at baryon drag ( $z \sim 1100$ )
  - Sets the **BAO** frequency

These are **standard rulers**

# 1. $H_0$ From the Sound Horizon

# BOSS Power Spectra

**BOSS DR12** [Alam+16]

- Two sky patches: NGC + SGC
- Two redshifts:  $\{0.38, 0.61\}$
- Total volume  $5.8 (h^{-1} \text{Gpc})^3$
- Much more coming soon...

# Galaxy Surveys: Measuring BAO

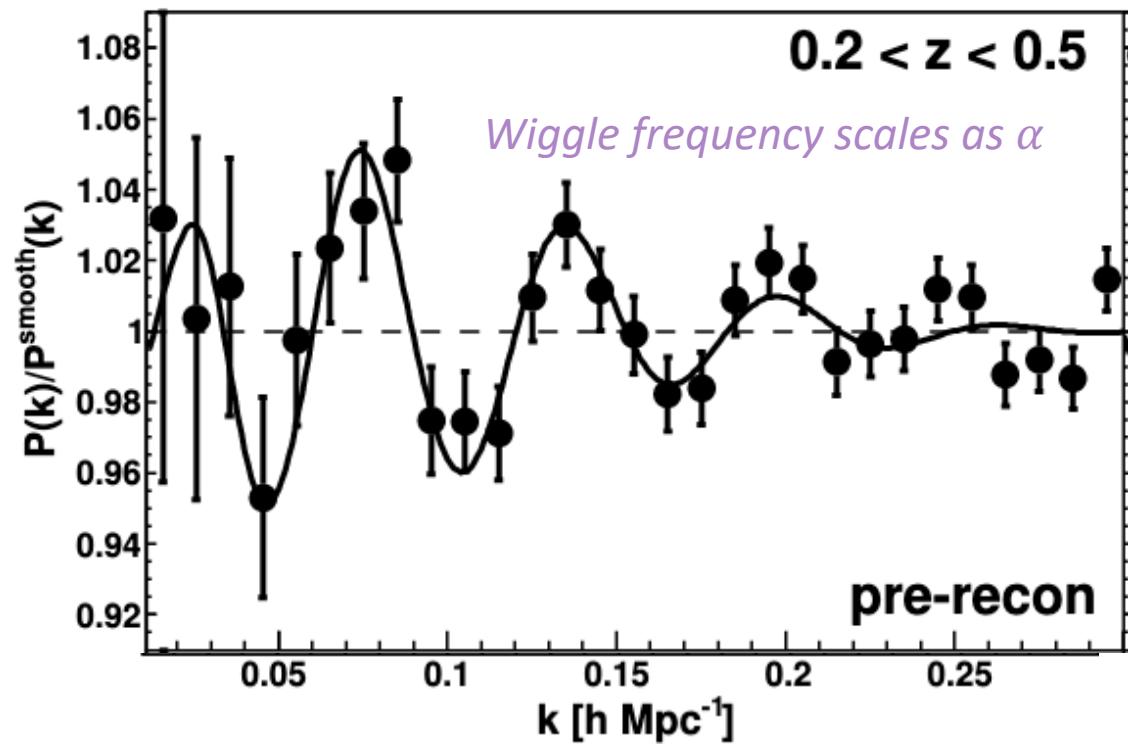

- Recent surveys measure 3 parameters:
  - Radial Alcock-Paczynski parameter:  $\alpha_{\parallel}$
  - Tangential Alcock-Paczynski parameter:  $\alpha_{\perp}$
  - Ratio of quadrupole and monopole:  $f\sigma_8$

- These encode **cosmology**:

$$\alpha_{\parallel} \propto \frac{1}{H(z)r_d}$$

$$\alpha_{\perp} \propto \frac{D_A(z)}{r_d}$$

- To constrain  $H_0$  we need to know  $r_d$ 
  - Fix from *Planck* or use priors from BBN

BOSS DR12 Power Spectra

# Galaxy Surveys: Measuring BAO

- Recent surveys measure 3 parameters:
  - Radial Alcock-Paczynski parameter:  $\alpha_{\parallel}$
  - Tangential Alcock-Paczynski parameter:  $\alpha_{\perp}$
  - Ratio of quadrupole and monopole:  $f\sigma_8$

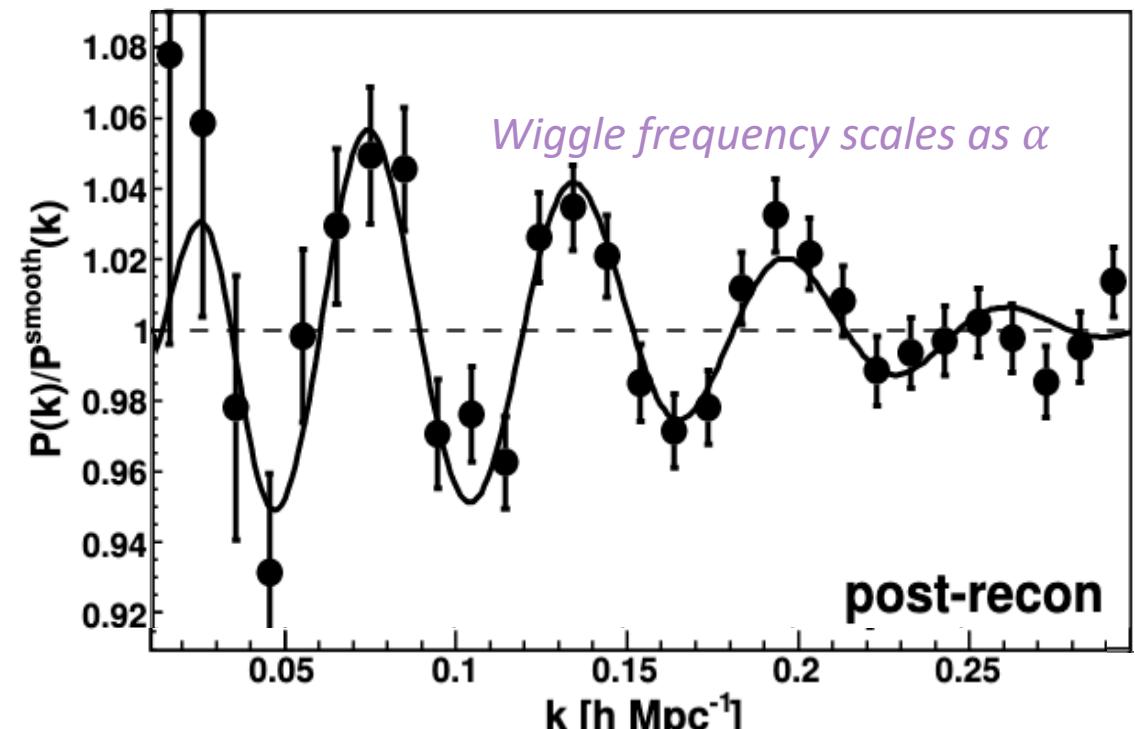

- These encode **cosmology**:

$$\alpha_{\parallel} \propto \frac{1}{H(z)r_d}$$

$$\alpha_{\perp} \propto \frac{D_A(z)}{r_d}$$

- To constrain  $H_0$  we need to know  $r_d$ 
  - Fix from *Planck* or use priors from BBN

- Results are improved by **reconstruction**

BOSS DR12 Power Spectra

# Galaxy Surveys: Beyond the BAO

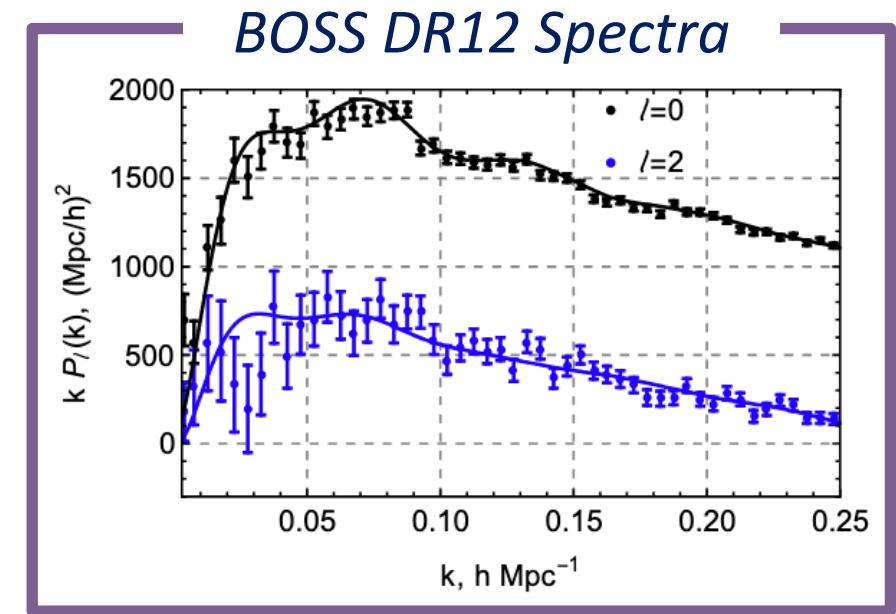

- Can we constrain cosmological information from **full shape** of the **unreconstructed** power spectrum?

- Model with the **Effective Field Theory of Large Scale Structure**, [Ivanov+19,20; d'Amico+19] including:
  - One-loop perturbation theory
  - Non-linear bias
  - Stochastic contributions (shot-noise)
  - UV counterterms
  - IR resummation

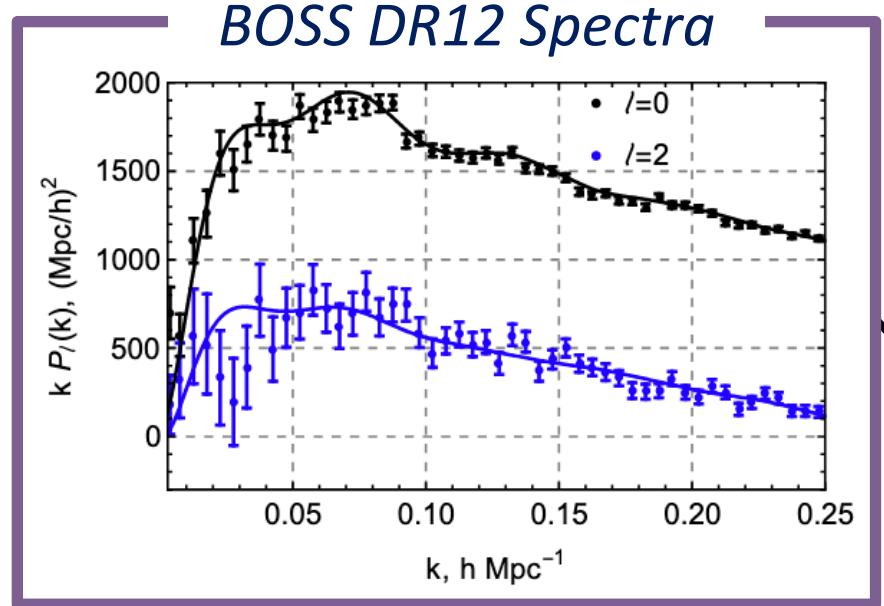

$$P_{g,\ell}(k) = P_{g,\ell}^{\text{tree}}(k) + P_{g,\ell}^{\text{1-loop}}(k) + P_{g,\ell}^{\text{noise}}(k) + P_{g,\ell}^{\text{ctr}}(k)$$

Linear Theory      1-loop PT      Shot-noise      Counterterms

- This has been tested on **huge** volume simulations [Nishimichi+20]

# Galaxy Surveys: Beyond the BAO

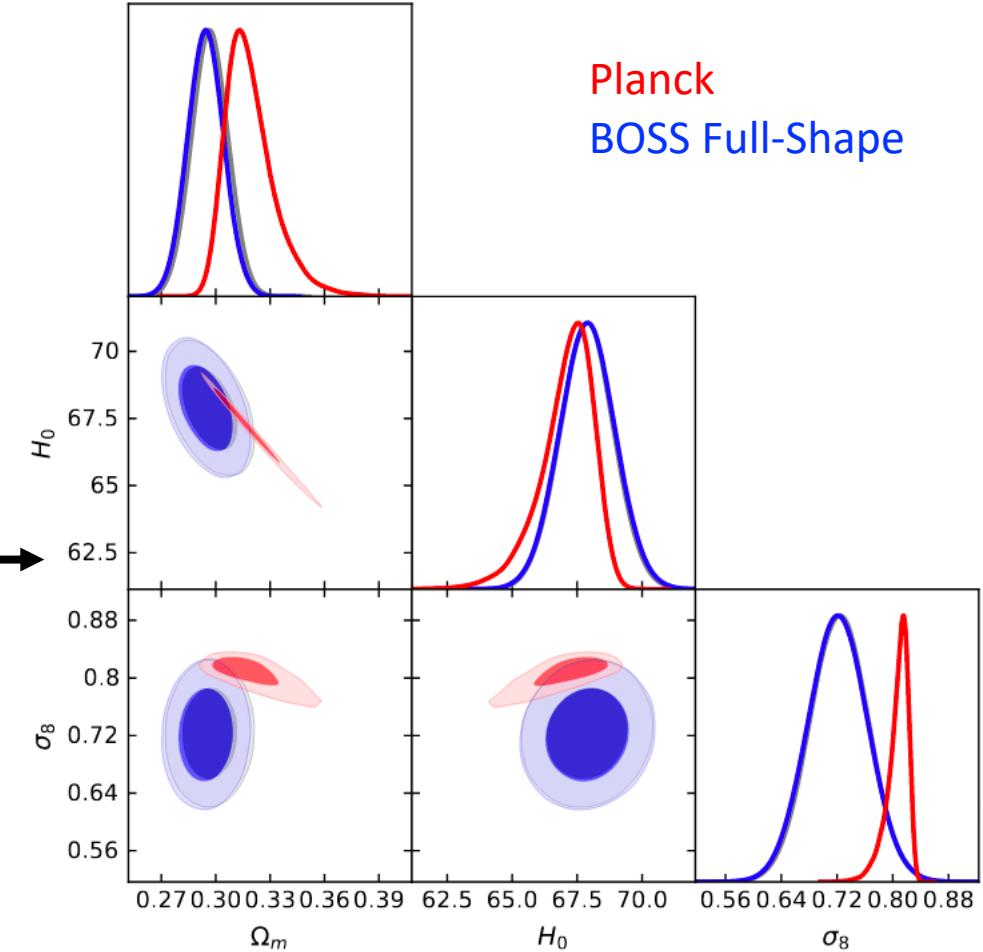

MCMC

$P_{g,\ell}(k) = P_{g,\ell}^{\text{tree}}(k) + P_{g,\ell}^{\text{1-loop}}(k) + P_{g,\ell}^{\text{noise}}(k) + P_{g,\ell}^{\text{ctr}}(k)$

Linear Theory    1-loop PT    Shot-noise    Counterterms

EFT Model

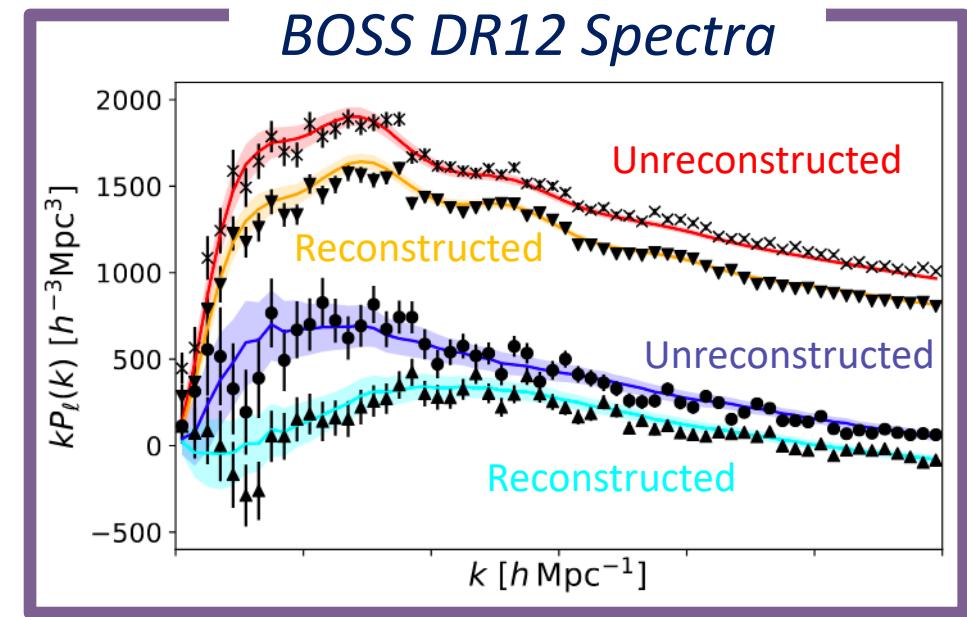

Including a BBN prior on  $\omega_b$

Ivanov+19

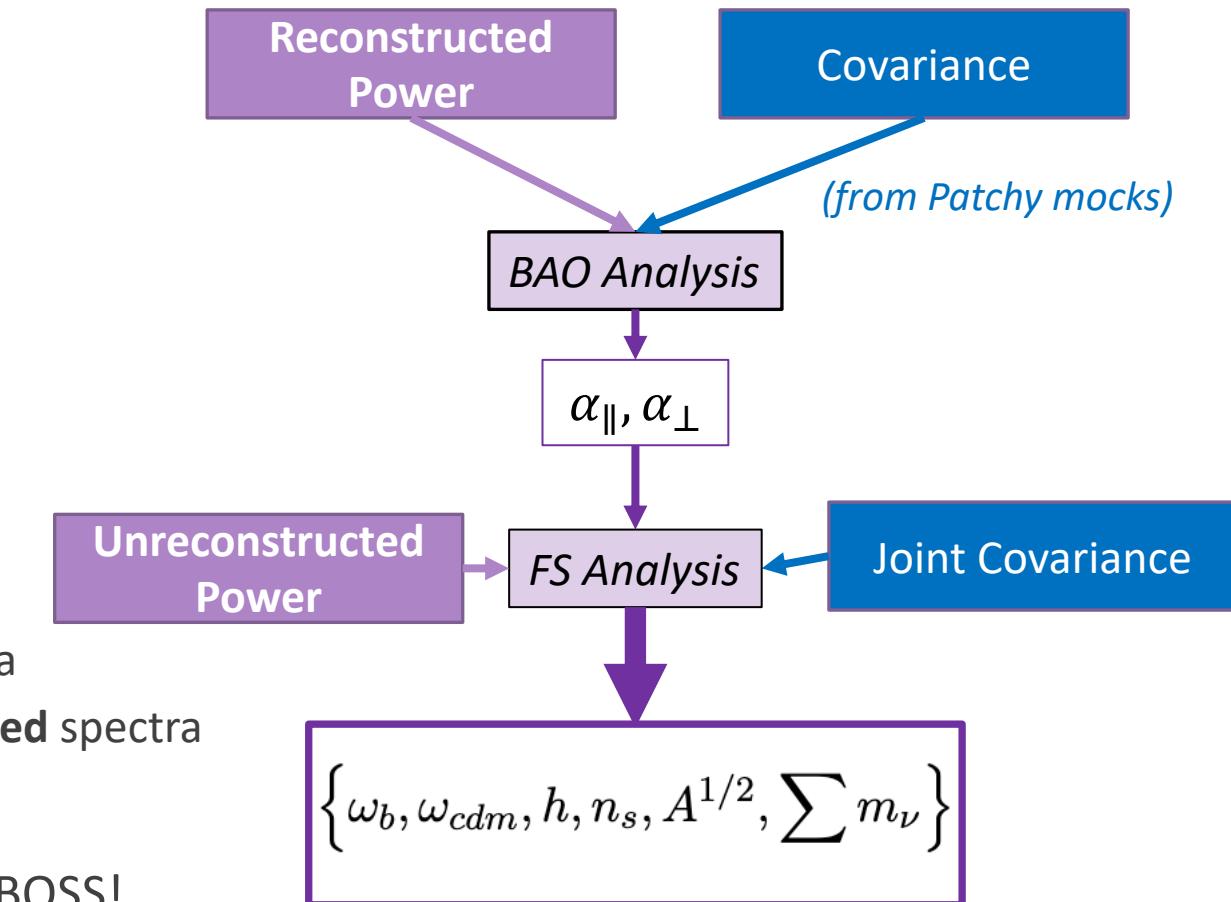

# Galaxy Surveys: Bringing back the BAO

- What about the **reconstructed** spectrum?
- This is **difficult** to model: [Hikage+17,19, Chen+19]
  - Broadband is distorted
  - Distortion depend on reconstruction schemes
  - Depends on modeling assumptions [Sherwin+19]

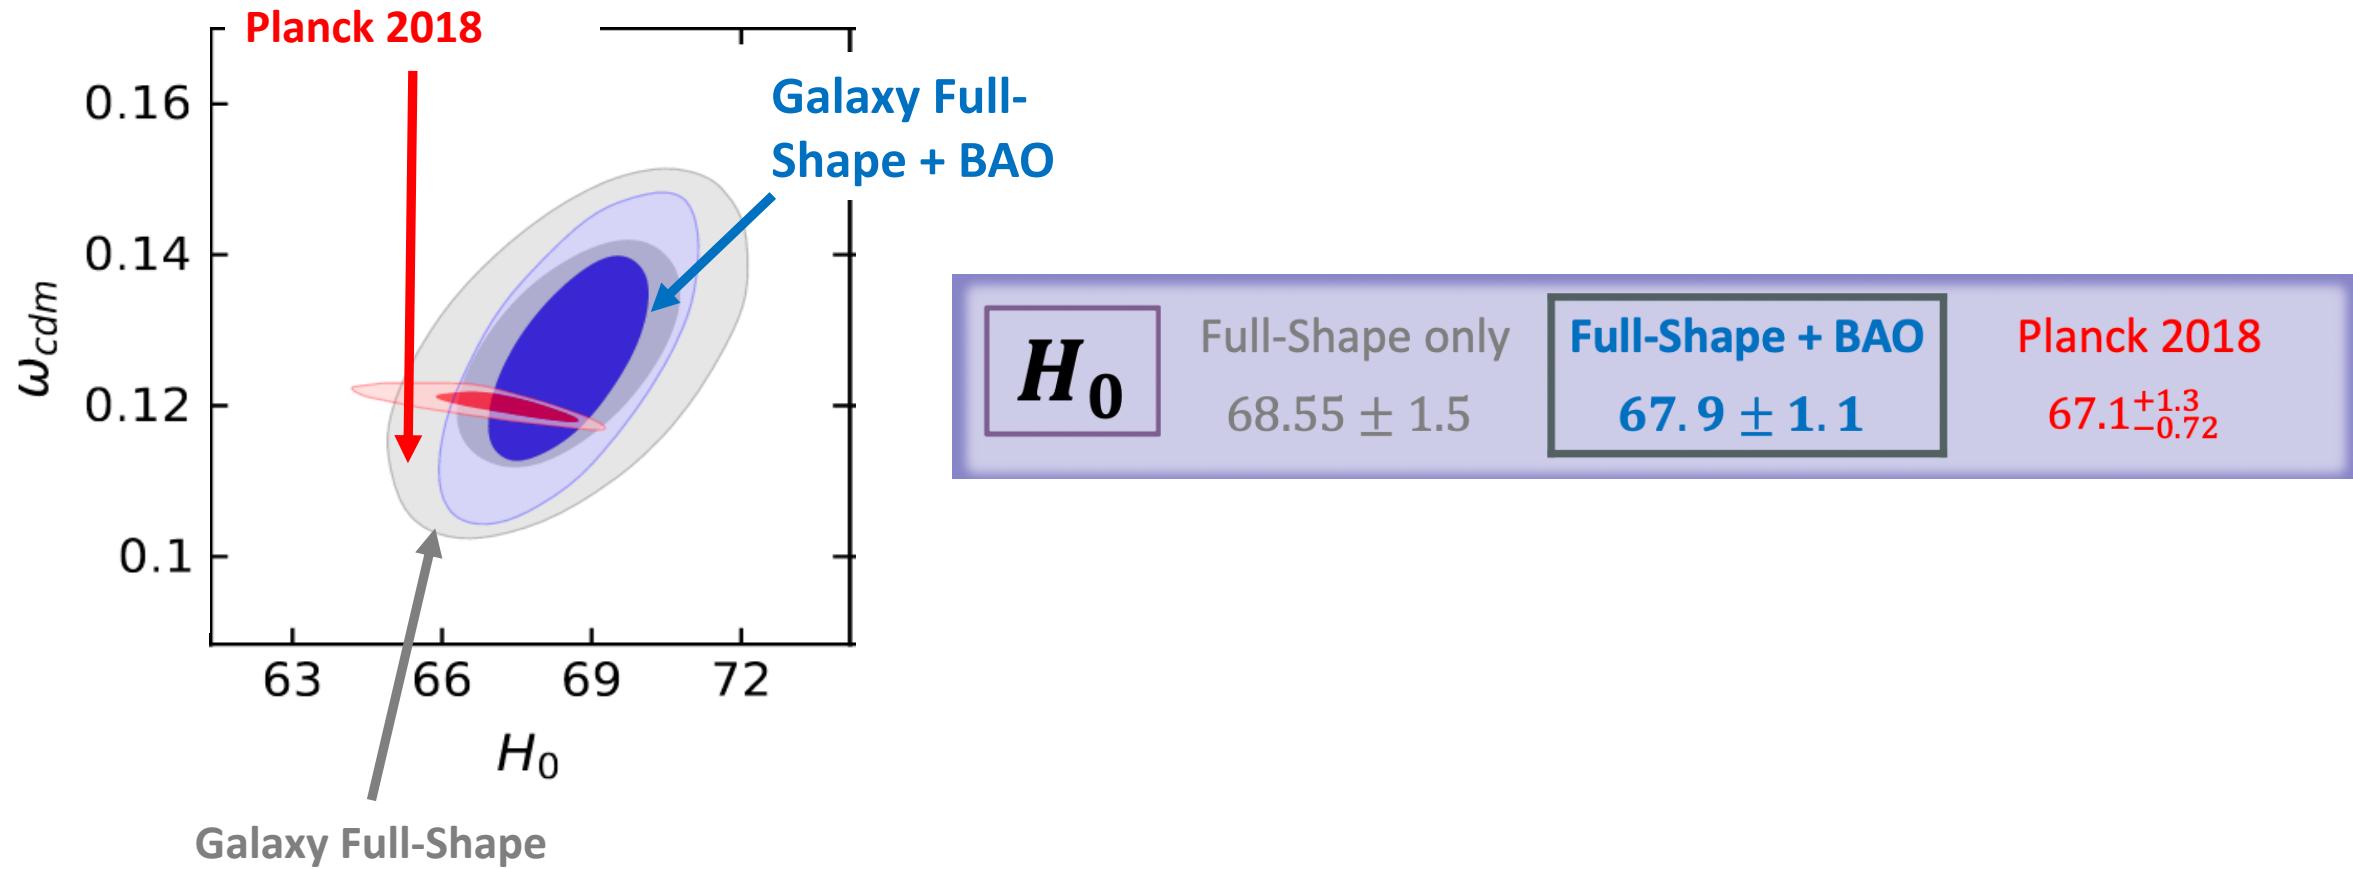

# Galaxy Surveys: Bringing back the BAO

- What about the **reconstructed** spectrum?
- This is **difficult** to model: [Hikage+17,19, Chen+19]
  - Broadband is distorted
  - Distortion depend on reconstruction schemes
  - Depends on modeling assumptions [Sherwin+19]
- **Solution:**
  1. Measure BAO parameters from **reconstructed** spectra
  2. Combine with **full-shape** likelihood for **unreconstructed** spectra
- This allows **more information** to be extracted from BOSS!

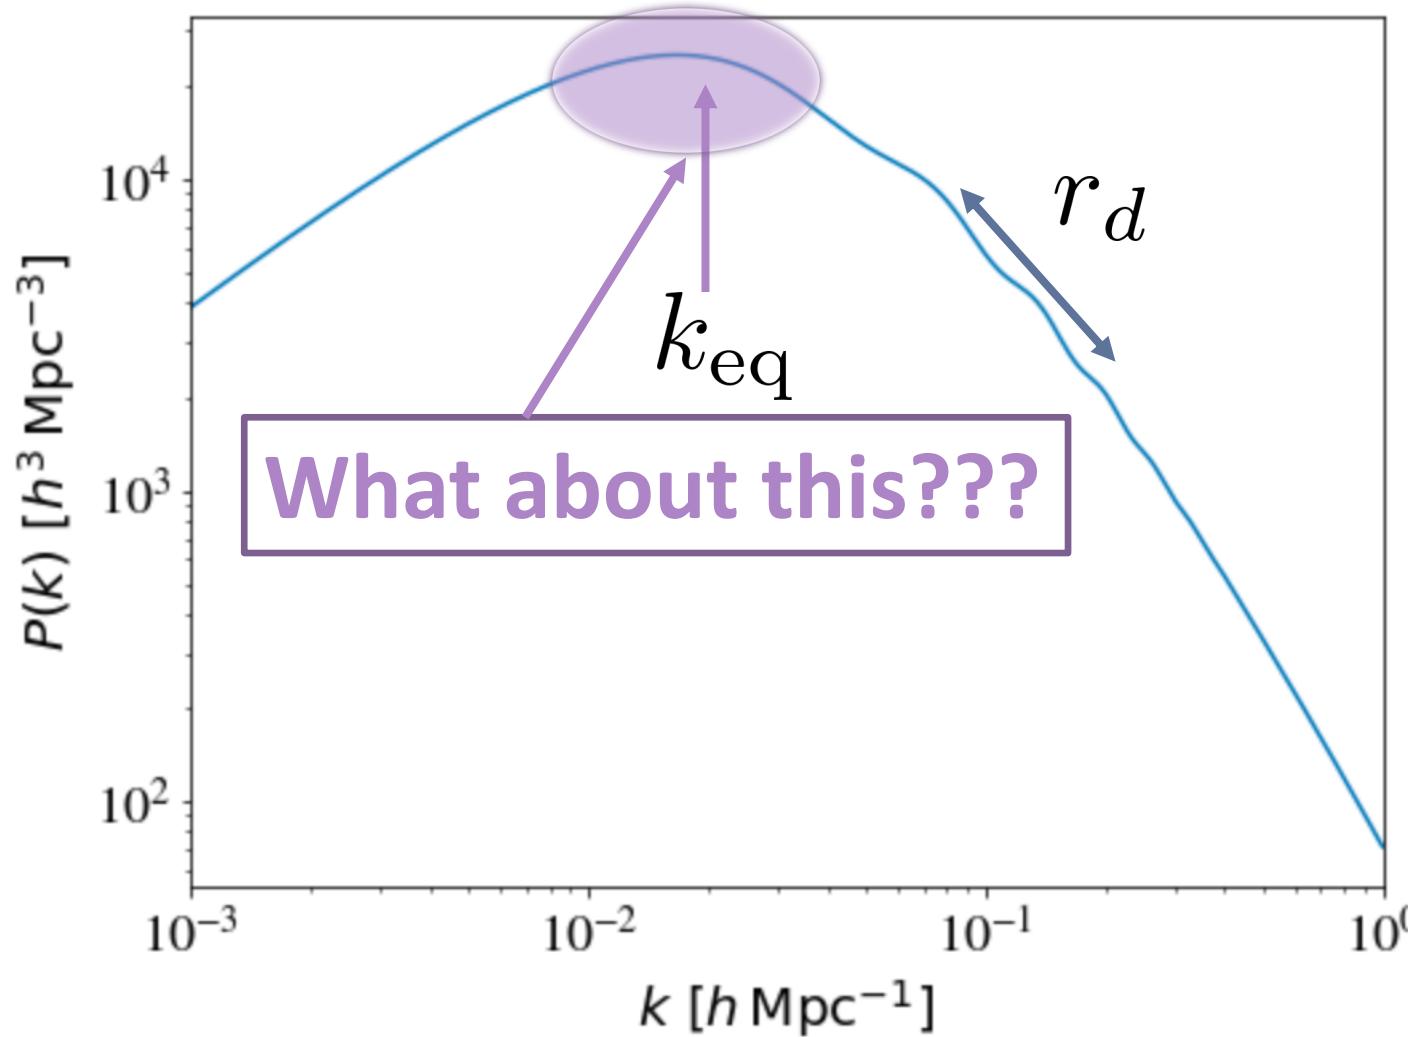

# Galaxy Surveys: Bringing back the BAO

## 2. $H_0$ Without the Sound Horizon

# Two Scales in the Matter Power Spectrum

1. The Equality Scale:  $k_{\text{eq}}^{-1}$ 
  - The **horizon** at radiation-matter equality ( $z \sim 3600$ )
  - Sets the **peak** and overall shape
2. The Sound Horizon:  $r_d$ 
  - The **sound horizon** at baryon drag ( $z \sim 1100$ )
  - Sets the **BAO** frequency

These are **standard rulers**

# The Equality Scale: A (New) Probe of H<sub>0</sub>?

- The **equality scale** acts contains  $H_0$  information

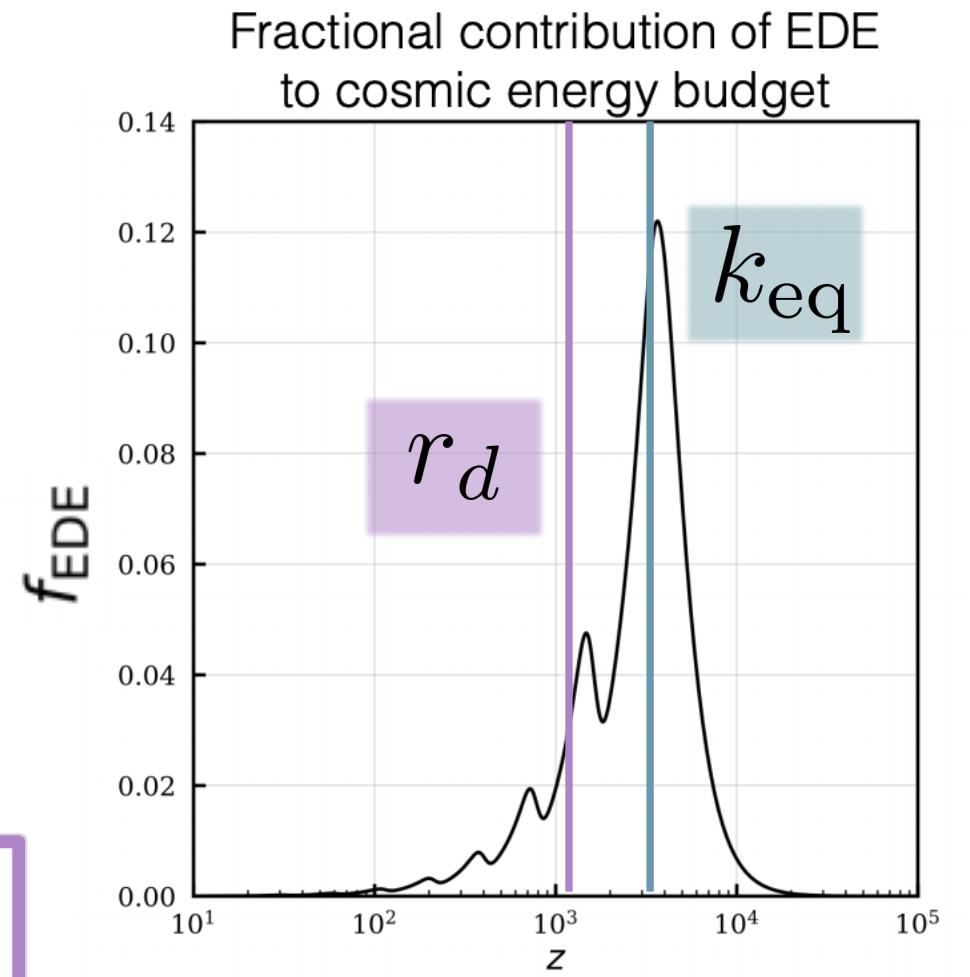

$$k_{\text{eq}} \propto \Omega_{cb} H_0^2 T_{\text{CMB}}^{-2}$$

- Measuring it in  $h \text{ Mpc}^{-1}$  units probes  $\Omega_{cb} H_0$

- Given a probe of  $\Omega_{cb}$  (or  $\Omega_m$ ) we can **constrain**  $H_0$ !

- This is a measurement of  $H_0$  at  $z_{\text{eq}} \sim 3600$ , much before recombination at  $z_d \sim 1100$

New physics at  $z \sim 10^3$  should affect **BAO** and  
**equality**  $H_0$  measurements **differently**

# The Equality Scale: A (New) Probe of H<sub>0</sub>?

- The **equality scale** was measured decades ago, through the **shape parameter  $\Gamma$**  [e.g. Percival+01]
- **Baxter & Sherwin (2020)** recently showed this could be measured from *Planck* lensing and Pantheon SNe, via

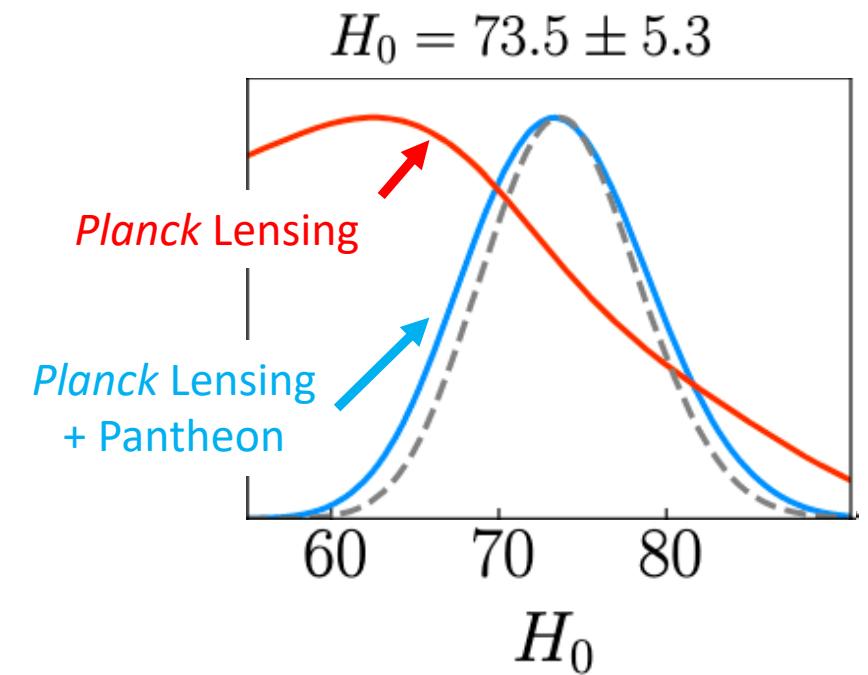

$$L_{\text{eq}} \equiv k_{\text{eq}} \chi_* \sim \Omega_m^{0.6} h$$

giving

$$H_0 = 73.5 \pm 5.3 \text{ km s}^{-1} \text{ Mpc}^{-1}$$

**independent** of sound horizon physics

- Can we do the same for galaxy surveys?

# Extracting Equality

- We can't see the equality scale directly in BOSS.

- It can be probed from the power spectrum **shape**:

$$P_g(k > k_{\text{eq}}) \approx b_1^2 A_s \left( c + \log \frac{k}{k_{\text{eq}}} \right)^2 \left( \frac{k}{k_{\text{eq}}} \right)^{n_s - 4}$$

- This is helped by knowledge of  $b_1^2 A_s$  from **loops** and **redshift-space distortions**
- Adding information about  $\Omega_m$  from **Pantheon** or **uncalibrated BAO** breaks the  **$\Omega_{cb} - H_0$  degeneracy**

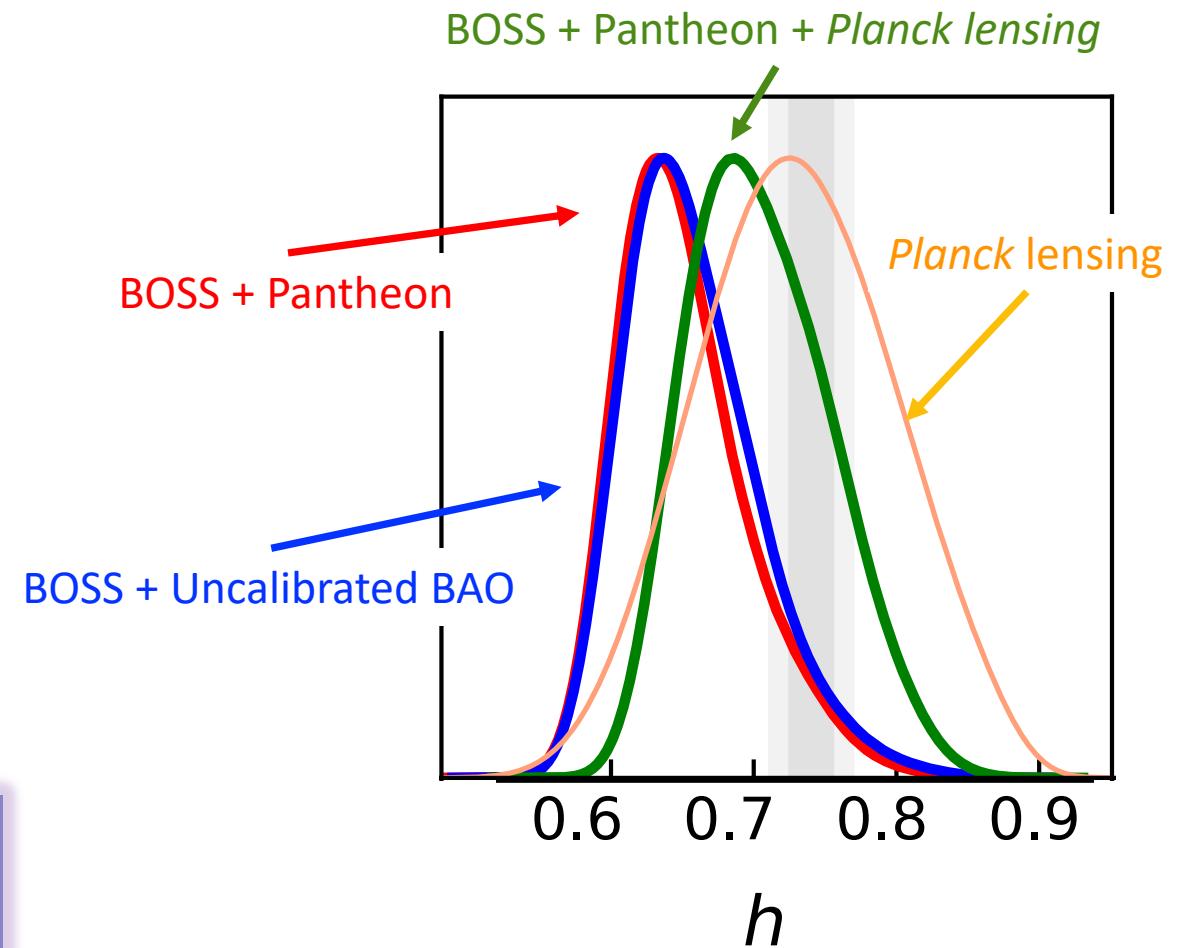

**Ansatz:** Analyzing the full-shape BOSS data **without** a restrictive prior on  $\omega_b$  will measure  $H_0$  from the **equality scale**

# $H_0$ Constraints from Equality

- MCMC results\*:

Dataset	$H_0$ (mean $\pm 1\sigma$ ) [km s $^{-1}$ Mpc $^{-1}$ ]
BOSS + Pantheon	$65.1^{+3.0}_{-5.4}$
BOSS + Uncalibrated BAO	$65.6^{+3.4}_{-5.5}$
BOSS + Pantheon + Planck Lensing	$70.6^{+3.7}_{-5.1}$

95% of the baseline **BOSS + Pantheon** posterior is **below** the SHOES best-fit, even without the **sound horizon**!

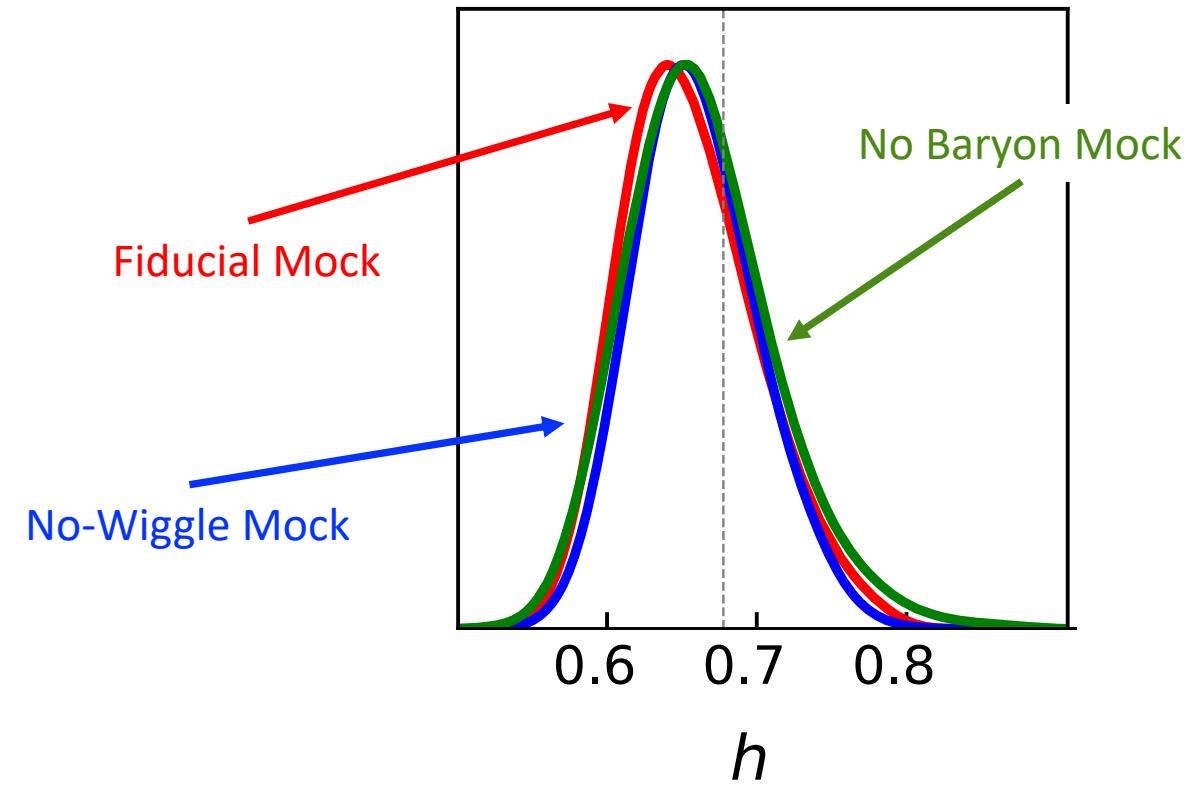

\*  $\{h, \omega_b, \omega_{cdm}, A_s, n_s, \sum m_\nu\} + 28$  nuisance parameters are varied in the likelihood

# Sound-Horizon Independence (I)

- Test on mock data:

1. Matching BOSS DR12
2. With suppressed **BAO wiggles**
3. With 10x less baryons

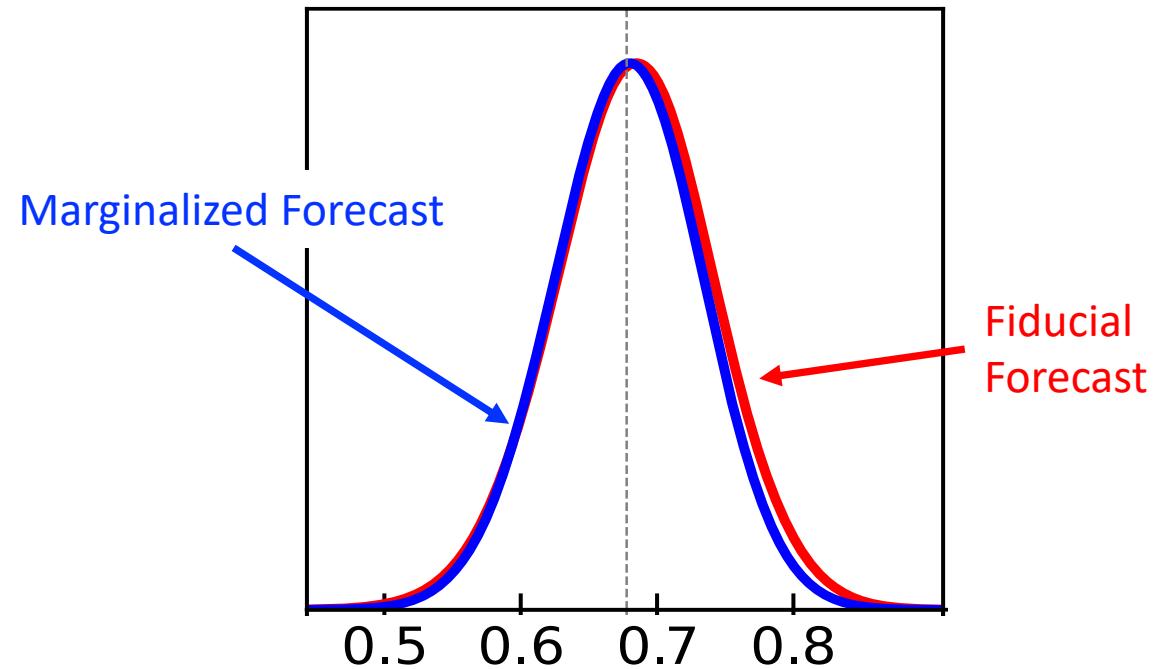

- No significant change to  $H_0$  constraints

- Information is **not** coming from the sound horizon!

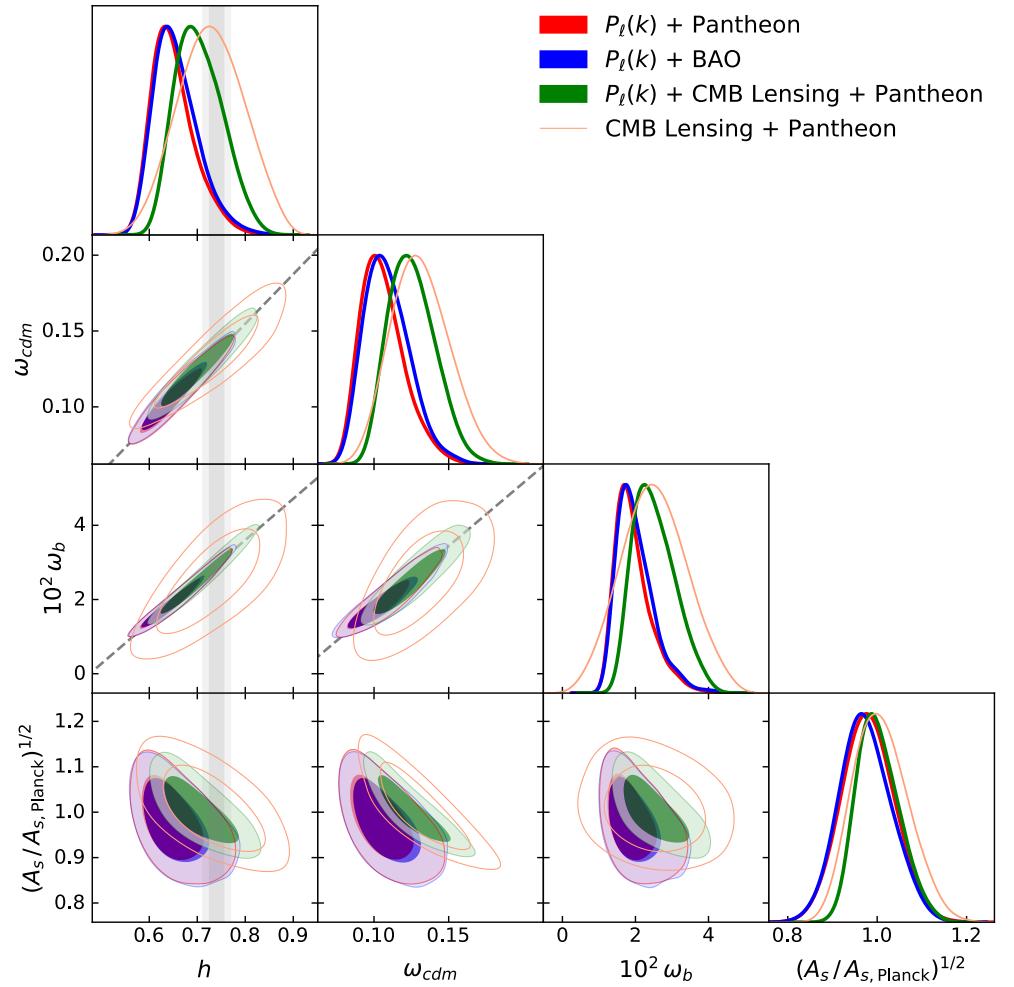

# Sound-Horizon Independence (II)

- Perform a **Fisher forecast** with an Eisenstein-Hu transfer function:
  1. Emulating BOSS DR12
  2. Marginalizing over  $r_d$
- No significant change to  $H_0$  constraints
- Information is **not** coming from the sound horizon!

# Cosmological Implications

- **BAO Constraints:** Probe  $H_0$  around  $z \sim 1100$
- **Equality Constraints:** Probe  $H_0$  around  $z \sim 3600$
- Discrepancy of  $H_0$  measurements could indicate **new physics** around recombination
- Consistency of  $H_0$  measurements would make some **beyond- $\Lambda$ CDM** solutions to the **Hubble tension** difficult
- A simple forecast for **Euclid** shows that  
$$\sigma_{H_0} \sim 1.5 \text{ km s}^{-1} \text{ Mpc}^{-1}$$
will soon be possible

# Conclusions

- Galaxy Surveys can place **strong constraints** on  $H_0$ , not just from the BAO

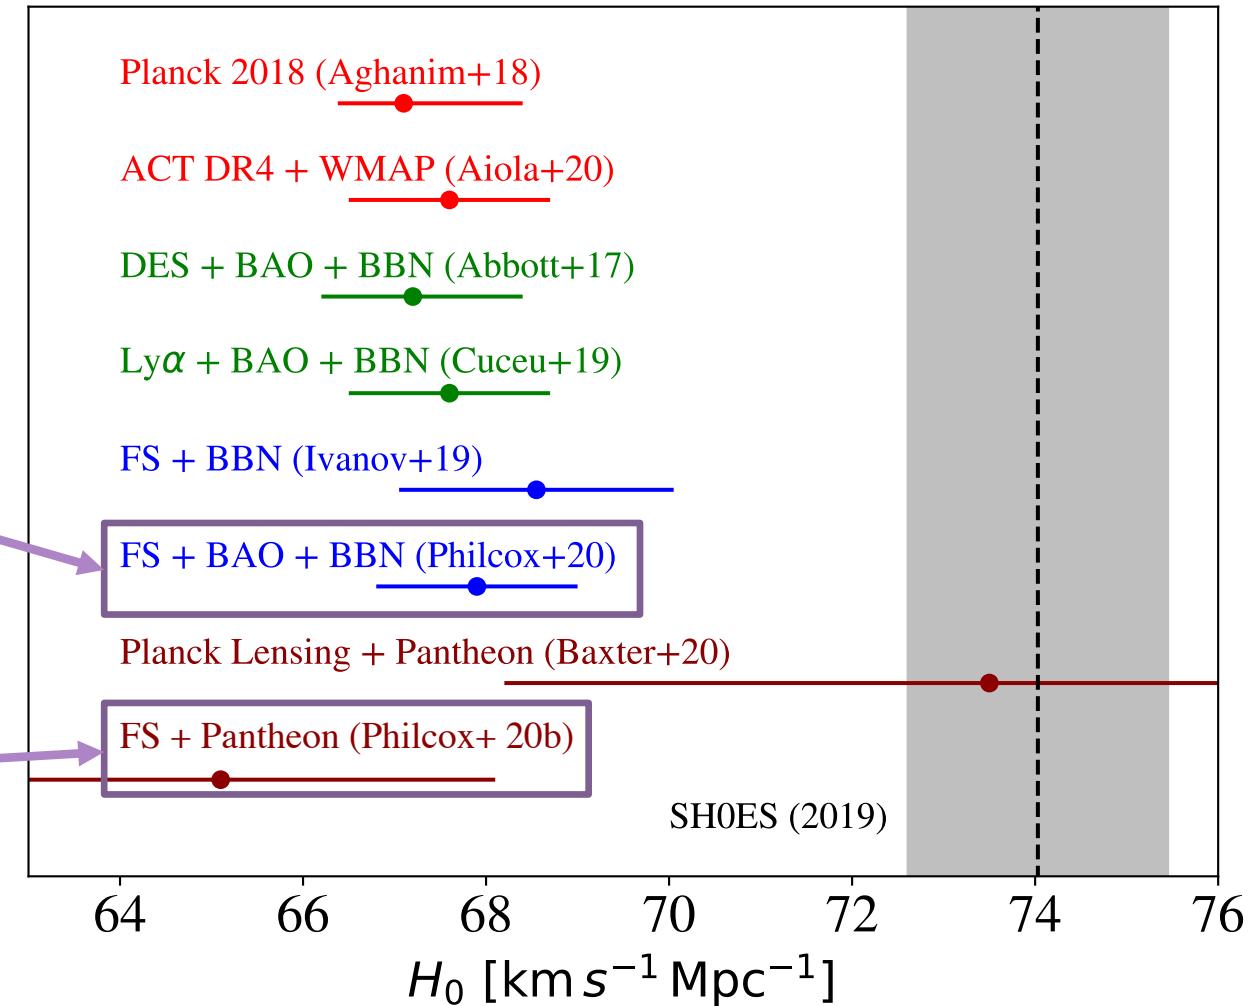

- Combining BAO and Full-Shape data (with BBN priors on  $\omega_b$ ) gives

$$H_0 = 67.9 \pm 1.1 \text{ km s}^{-1} \text{ Mpc}^{-1}$$

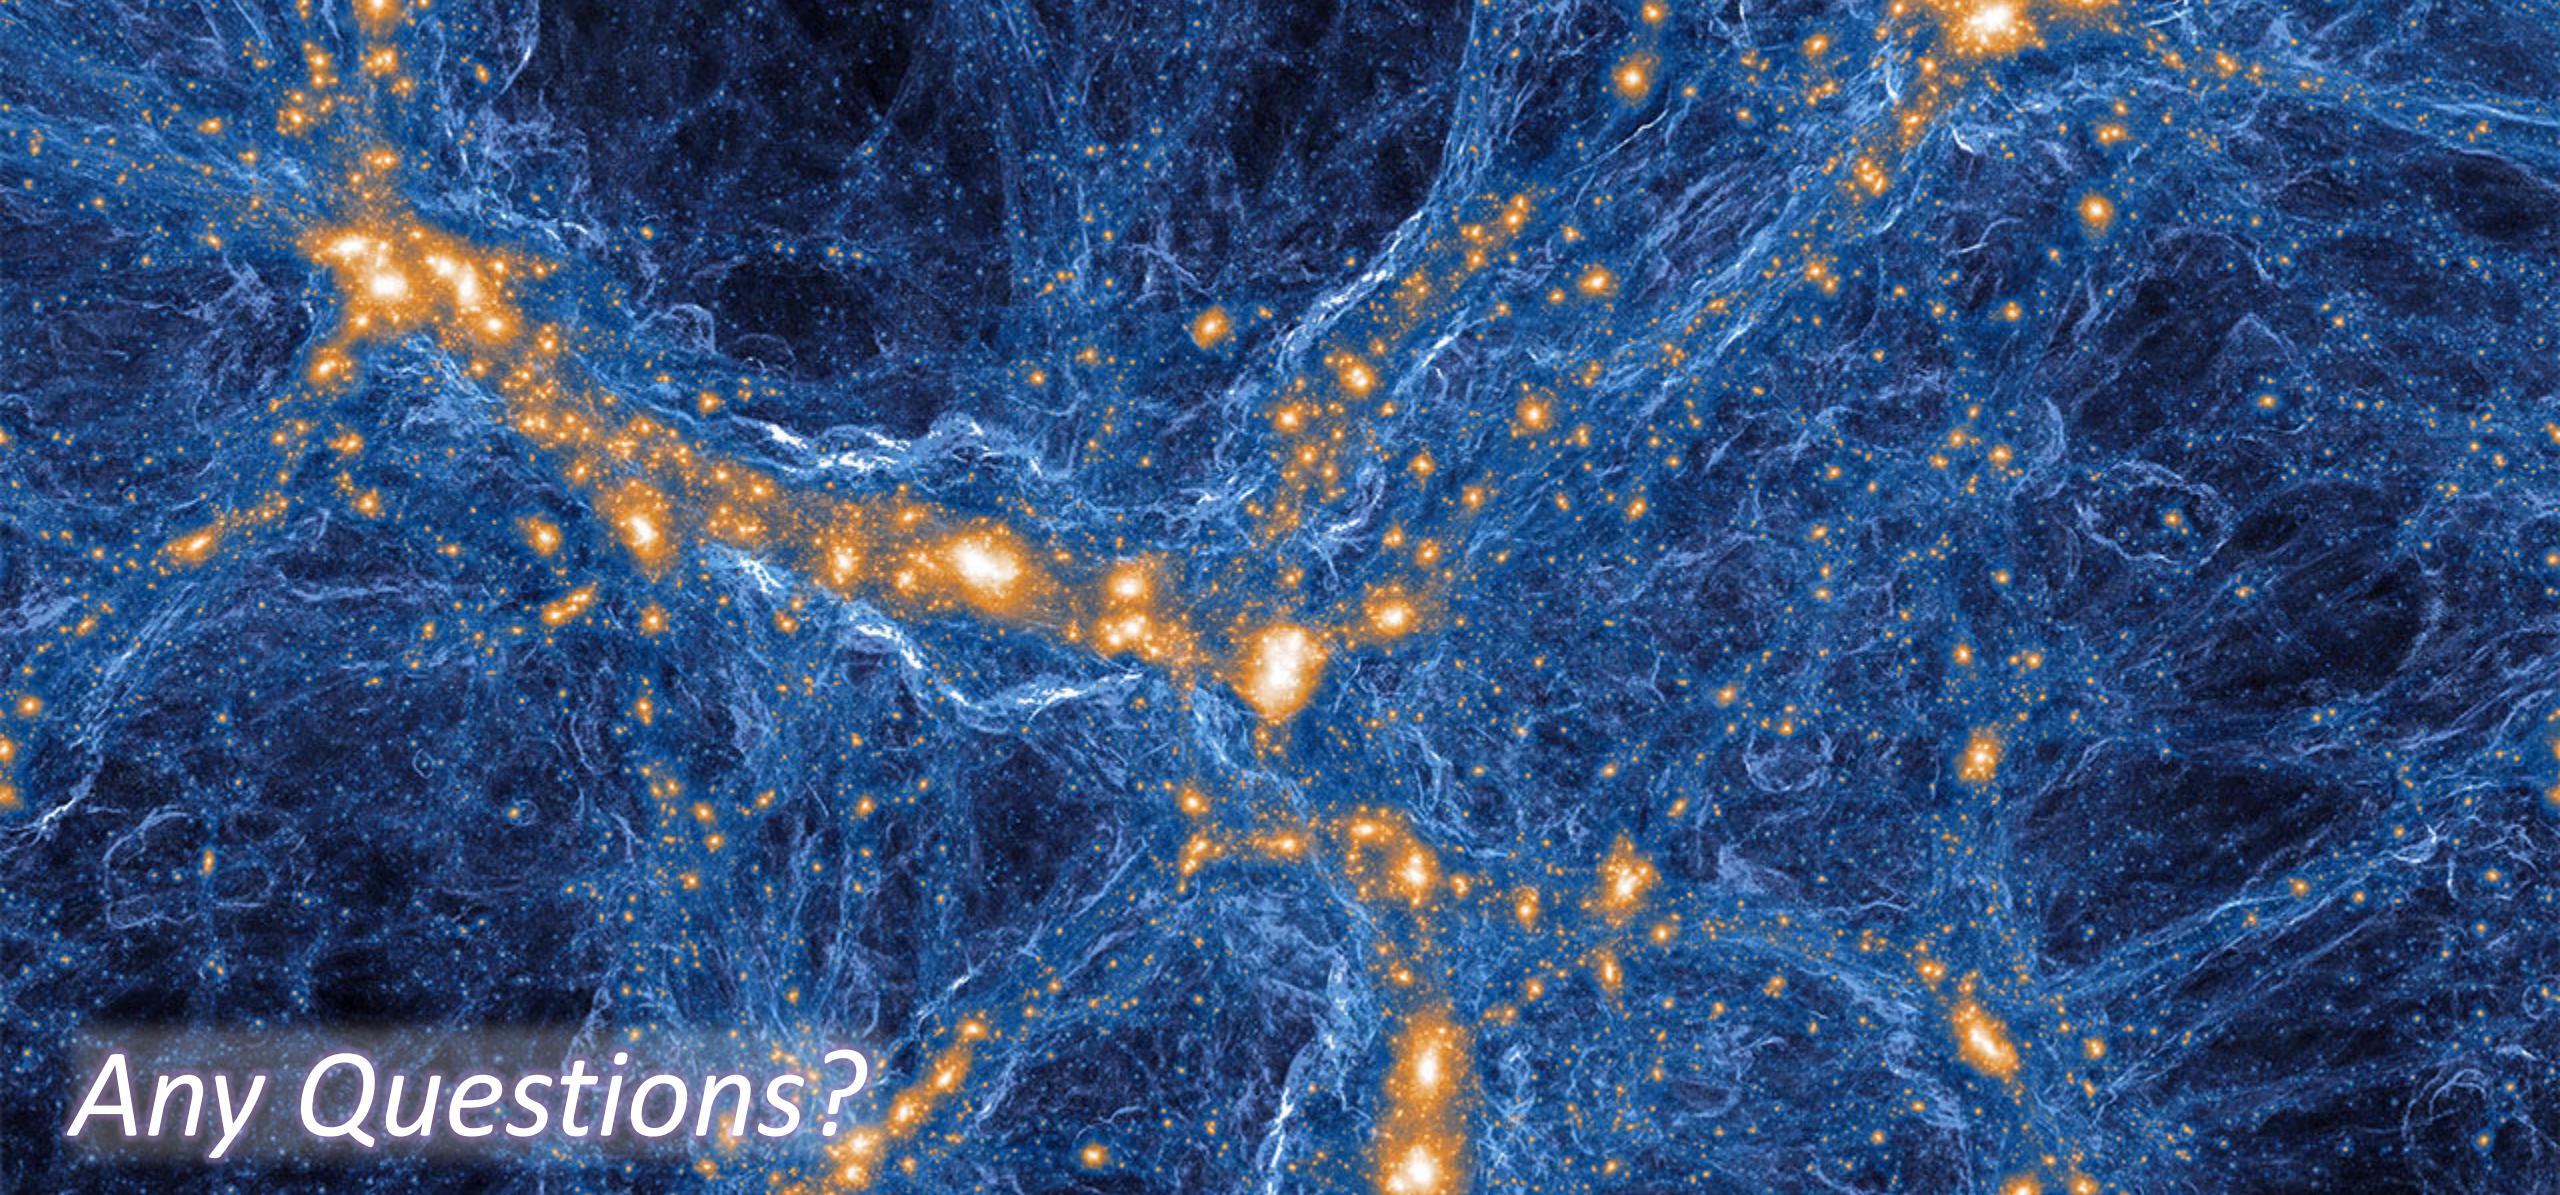

- Using Full-Shape data (and Pantheon priors on  $\Omega_m$ ) gives

$$H_0 = 65.1^{+3.0}_{-5.4} \text{ km s}^{-1} \text{ Mpc}^{-1}$$

independent of sound horizon physics!

*Disclaimer:  $1\sigma$  errors do not fully represent non-Gaussian posteriors.*
